

Mosquitoes love global warming.

Mosquitoes love global warming. Hotter, wetter conditions are great for breeding them. And the more mosquitoes there are, the more pressure there is to kill them off by unnecessarily spraying the places we live with toxic insecticide.

So, to help stop the wholesale spraying of toxic chemicals, we need to fight global warming. And that means cracking down on the greenhouse gas pollution that is warming the planet.

There is a relatively simple way for our country to slash greenhouse gas pollution in half in 20 years – and we can do so while creating more jobs, growing the economy and leaving most Americans with more money in their pockets.

How?

Find out Monday night (Sept. 24) at West Chester University. ... and learn how ordinary citizens like you can help make it happen.
